

1 REQUEST PATH

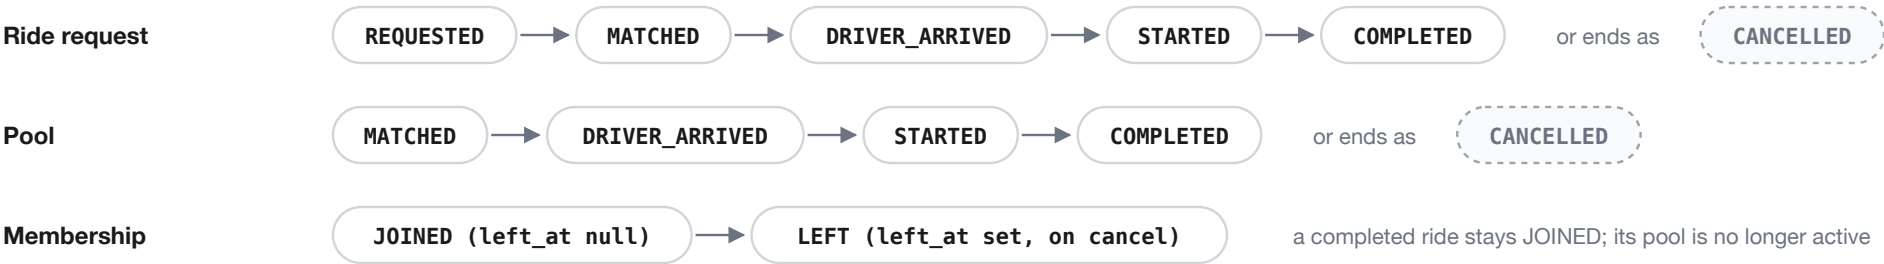

Guards: session → role, then ride ownership in the service. Public: /health, /zones, /auth/signup, /auth/login. A lower layer never imports an upper one.

2 DATA MODEL

3 LIFECYCLES

Driver cancels before the start: riders go MATCHED / DRIVER_ARRIVED → REQUESTED, the pool → CANCELLED. Passenger cancels before the start; last one out closes the pool.

Joins (M1–M4): same pickup zone, pool still MATCHED, seats free, every detour ≤ 2 km. Any other transition is rejected (409); every ride status change writes a ride_event.
